

Drilling Spools

Canam offers adapter spools, spacer spools, drilling spools, riser and diverter spools in accordance with API 16A requirements. Each spool can be specially manufactured to meet height requirement needs, number of outlets and orientation. All spools can be fabricated with hub or flanged connections. Each spool is drift tested to ensure that access to the well-bore is not restricted. Spools are typically manufactured using API 75K 4130 Material that meets NACE MR0175 requirements for H2S Service.

Double Studded Adaptors

We stock a wide variety of Double Studded Adaptors (DSA). They enable the user to transition from one size and pressure to another. Most sizes and pressure rating configurations are in-stock for immediate shipment. When the required size and pressure combination is not in stock, it can be manufactured or re-manufactured to fit virtually any combination. All DSA meet API 6A requirements. Typically B7 all-thread studs are installed with grade 2H nuts, but tapped-end and plated studs can be installed when specified at the time of order.
